

Dead components on dev: what is true, why it happened, and what to do about each

CSJ stopped a bulk deletion of 79 "orphaned" Vue components this morning and asked two things: prove it is actually a defect, and explain why it is happening. Then a harder question: if the code was built, why was it not mounted, and is it not all needed? This report answers all three, against **dev** as served on csjones.

1. Summary

It is real, it is larger than the board says, and "dead" does not mean "not needed".

Measure	Count
Vue components under resources/js/components and resources/mobile/components	527
Flagged by the W-0540 guard (substring search)	79
Unreachable from either Vite entry by walking real imports	152
Views under resources/js/views that no route reaches	2 of 166
Dead component names found in the compiled csjones bundle	1 of 152, a name collision with a live view
Dead components kept green by a vitest spec	32
Dead components edited in August or September 2026	18

The 152 fall into four different stories, and they need four different answers:

Story	Roughly	What to do
Superseded by a live rebuild doing the same job	100	Delete, after a per-file check that no detail was lost
Built, still advertised, no screen, no Fyn tool: the advanced investment analytics	12	CSJ decision: re-mount, or retire the claims in Help, README and vault
Built and never mounted	2	One superseded, one a missing marketing feature
Smaller feature gaps and one live dead end	6 plus 1	Itemised in section 6

Nothing has been deleted. Section 10 lists the decisions that are CSJ's.

2. The product these components belong to

Read from the constitution, the public site, the tier seeder and the routers. This is here because the recommendations depend on it, and because it was missing from every previous session's reasoning about this item.

Vision (**workforce/core/constitution/01-mission.md**, adopted verbatim): every UK household should plan its money the way the wealthiest families do, seeing business, pension, property and estate as one living picture, and pay £20 a month for it, not £20,000 a year. Fyn is what makes that price possible: the reasoning of a £500-an-hour adviser, always on, never scolding, never selling a product.

Who is defined by life stage, not income. The six seeded personas are the market: student, young saver, young family, entrepreneur, peak earners, retired couple. Households, not users; the north star is Paid Active Households.

Why: three founders with over 40 years in UK financial services saw the planning tools locked behind professional gatekeepers or too complicated for a kitchen table. "The sat nav for your financial life." Not FCA-authorised, guidance not advice, fail-closed in code. No products, no commission, no bank connections, no advertising.

What: one dashboard across pensions, investments, savings, property, protection and estate; eight agents over seven modules plus tax optimisation, every tax value from configuration; Fyn as the single voice across web, **/m** and native iOS. The side menu is the product map: Dashboard and Net Worth; Cash Management; Finances (investments, retirement, property, liabilities, valuables, risk profile, business); Family or Personal Affairs (protection, will, letter to spouse, trusts, estate, power of attorney); Planning (holistic plan, tax strategy, plans with PDF export, journeys, what-if, goals, life events, actions).

How it is used: arrive through the Save Tax funnel or the preview personas; register with an email code; Fyn-led onboarding, forms, or statement upload on Premium; fifteen to twenty minutes, no bank logins; the dashboard is the "aha moment"; then modules, plans, what-if levers and the actions list. Spouses link. Phones route to **/m** with the level wheel. Free is permanent with count caps; Premium is £6.99 a month or £59.99 a year; the seeder **TierConfigurationSeeder.php** is the contract.

The consequence for this report: **an investment analytics engine is not decoration in this product. "The way the wealthiest families plan" is the promise.** A component that delivered part of that promise and fell out of the bundle is a lost feature, not clutter.

3. Instruments, and which one to trust

Three instruments were used. They agree where they overlap, and the disagreement is itself a finding.

The W-0540 guard (`tests/Architecture/EveryComponentIsRenderedSomewhereTest.php`) counts a component alive if its basename appears as a substring in any file under `resources/js`, `resources/mobile`, `tests/frontend`, `resources/views` or `public/pages`. That leaks three ways:

- a dead parent keeps its dead child "alive": `Estate/TrustForm.vue` is mentioned only by `Estate/TrustPlanning.vue`, which nothing renders either; 34 of the 73 it misses are this;
- a spec keeps it "alive": 32 dead components have a passing vitest spec;
- substring collisions: `NetWorth` matches 39 live files, `GoalForm` matches `GoalFormModal`, `StrategyCard` matches `DecumulationStrategyCard`.

An import-graph walk (`reach.mjs`, scratchpad) starts from the two Vite entries, `resources/js/app.js` and `resources/mobile/main.js`, follows every `import ... from`, `import()` and `require()` through the `@` and `@m` aliases, and reports every component the graph never reaches. It reaches 758 modules. Validated before use: `AppLayout`, `PublicLayout`, `MobileChrome`, `TrustsOverviewCard` and `TrustCard` are all reached; 164 of 166 views are reached; there are no template-literal dynamic imports, no `import.meta.glob` over components, and no global registration on either entry. Every one of the guard's 79 is inside its 152, so the guard has no false positives, only misses.

The compiled bundle on csjones. All 268 JavaScript chunks the csjones manifest lists were downloaded and grepped for `name:"X"` and `__name:"X"`. 151 of the 152 are absent. The one hit, `WhatIfScenarios`, is the live view `views/Planning/WhatIfScenarios.vue` sharing a name with the dead `Protection/WhatIfScenarios.vue`. Nine live controls are all present. Neither unrouted view is in the manifest. The component tree and every import line are identical between `origin/dev` at `41771cca0` and the working branch, so these are dev's numbers.

Two earlier measurements are withdrawn: the board's 79 was an under-count, not a count, and the mid-session report of two "guard false positives" was a `comm` collation artefact, not real.

4. Why nothing fails when a component dies

Four properties of the stack combine.

1. **Vue resolves tags by name at runtime.** A template that uses a component it never imported renders an empty custom element. The only signal is a console warning, and only in dev mode. Production shows nothing and throws nothing.
2. **Vite builds from one entry per bundle** by following imports. A file nothing imports is silently left out. The build is green, and smaller.
3. **Vitest mounts components directly**, so a spec keeps a dead component green forever.
4. **Lint checks unused imports inside a file**, the opposite direction. Commit `9e865394c` on 16 July "cleared whole-range frontend lint" by deleting six imports from `NetWorth/InvestmentList.vue`; those six lost their last importer in a commit whose purpose was a green Cl.

So three ordinary events orphan a component with no signal: a page rewrite that deletes the parent, a cleanup or lint fix that removes the import, and a feature that is built and never mounted. Until yesterday no check had ever looked in this direction.

5. How the 152 got there

Added	Count
October 2025	55
November 2025	28
December 2025 to March 2026	66
After May 2026	3

78 of the 152 were last touched in March 2026, which is when the parents went:

Date	Commit	What it replaced
2026-02-24	<code>c135176e3</code> goals cleanup	the old goals components
2026-03-04	<code>e2230efc5</code> holistic plan rewrite	<code>Investment/PlanSections/*</code>
2026-03-20	<code>717d24f97</code> onboarding form cleanup	deleted <code>JourneyCompletionStep.vue</code>
2026-03-22	<code>c4e6caf70</code> UK Taxes page deleted	<code>Dashboard/TaxOptimisationCard</code> and kin
2026-03-23 to 25	dashboard nav restructure, batch 9	the old <code>Dashboard/*</code> cards
2026-03-26	<code>9d0e73697</code> unify completeness	<code>ProfileCompletenessAlert</code> on the protection view
2025-12-15	<code>3665b4feb</code> Net Worth redesign	hid the portfolio tabs, "components still available for detail views"
2026-07-16	<code>9e865394c</code> lint clearance	cut those tabs' imports

Four dead-code sweeps, on 26 February, 9 April, 18 April and 6 July, each deleted what someone noticed and built no guard. The 12 May conventions review counted "106 candidates, at least 30 confirmed" and wrote "should be deleted", but was research-only and never became a board item.

6. Findings by cluster, each with a recommendation

6.1 Superseded by a live rebuild

The March rebuilds replaced these with live components doing the same job and left the old ones behind. Confirmed pairings:

Dead	Live replacement
Retirement/DrawdownSimulator, AnnualAllowanceTracker, IncomeProjectionChart, AccumulationChart, TaxBreakdownCard, RequiredCapitalDetail, StrategiesTab, StrategyCard	pension list tabs: RetirementIncomeTab, DecumulationStrategyCard, PensionPotProjectionChart, CapitalAdequacyTab, FutureValueTab
Investment/PlanSections/* (7)	Plans/Investment/InvestmentPlanContent and its sections
Goals/GoalMilestoneTracker, GoalContributionStreak, GoalsList, GoalsAnalysis, GoalsByModule, GoalCard, GoalCountdown, ChartTypeToggle, EventIconsOverlay, EventTooltip	Goals/GoalsDashboard, GoalsOverview, GoalProgressBar, GoalDetailInline, GoalsProjectionChart
Investment/RebalancingActions, RebalancingCalculator, CGTHarvestingOpportunities, FeeSavingsCalculator, TaxFees, BedAndISATransfers	AccountRebalancingPanel, TaxEfficiencyPanel with HarvestLossModal, FeeBreakdown, AccountFeesPanel, BedAndISAWizardModal
Protection/GapAnalysis, ProtectionOverviewCard, RecommendationCard, CoverageGapChart	Protection/ProtectionModuleOverview
Estate/LifePolicyStrategy	Estate/LifeCoverRecommendations
Dashboard/SpousalOptimisations, CrossModuleInsights, TaxOptimisationCard	TaxStrategy/HouseholdCoordinationPanel, the holistic plan, the tax strategy page
Dashboard/* cards, Gamification/LevelCard	views/GamifiedDashboard.vue, which Dashboard.vue renders unconditionally and which carries the level pie and bar
Risk/CapacityForLossSection, TimeHorizonSection, RiskFactorsPanel	Risk/RiskProfilePage, RiskFactorDetailPage, FactorBreakdownCard
NetWorth/Property/PropertyTaxCalculator	NetWorth/Property/PropertyFinancials (stamp duty)
WhatIf/ScenarioDetail, Protection/WhatIfScenarios, ScenarioBuilder, Investment/WhatIfScenariosBuilder	Planning/WhatIfDashboard, WhatIfScenarioDetailView, ModuleComparison
Legal/StrategyDisclaimer	the site-wide disclaimer in AppFooter and AiChatPanel
Public/CalculatorCard	the server-rendered public/pages/calculators.php
Admin/Admin*Actions, *ActionModal	Admin/AdminPanel and its tabs

Recommendation: delete, directory by directory, but only after a per-file diff read that asks one question: does the dead file contain a rule, a figure, a caption or a state the live replacement lacks? W-0376 was exactly a dead site carrying its own copy of a rule. Any such finding becomes a board item before the file goes. The 32 specs that mount dead components go with them, and two constants specs that pin dead file paths, constants/__tests__/assetTypes.spec.js and retirementAge.spec.js, need their lists edited. FreemiumCopyContractTest.php:25 pins CalculatorCard and needs its entry moved to deleted with the counts adjusted, as the handover already noted.

Not verified: the UserProfile/* cluster (balance sheet, cash flow, income statement, tax summary). views/UserProfile.vue and views/ValuableInfo.vue today render personal information, income, expenditure, the letter and the risk summary; I did not find a live balance sheet or profit-and-loss statement. Treat that cluster as section 6.6, a product decision, not as superseded.

6.2 Lost but still advertised: the advanced investment analytics

These were built end to end and today have no screen, no Fyn tool and no /m surface:

Investment/EfficientFrontier, CorrelationMatrix, PortfolioOptimizer, PortfolioOptimization, PerformanceAttribution, BenchmarkComparison, PerformanceLineChart, AssetLocationOptimizer, WrapperOptimizer, AllocationComparison, GeographicAllocationMap, MonteCarloResults.

The backend is live and maintained:

Engine	Files	Last commit	Test files
Services/Investment/Analytics	Markowitz optimiser, efficient frontier, covariance and correlation, portfolio statistics	2026-05-28	2
Services/Investment/Performance	alpha and beta, benchmark comparator, attribution analyser	2026-06-05	1
Services/Investment/AssetLocation	asset location optimiser, tax drag, account type recommender	2026-07-06	3
Services/Investment/Rebalancing	drift, tax-aware rebalancer	2026-08-14	3

Routes at `routes/api.php:651-763` serve efficient frontier, correlation matrix, minimum variance, maximum Sharpe, target return, risk parity, asset location, performance attribution and multi-benchmark comparison. Nothing under `app/Services/AI` names any of them, so Fyn cannot surface them either.

The promises are still live: `views/Help.vue:313` "Risk metrics (Alpha, Beta, Sharpe Ratio, Volatility, Max Drawdown, VaR)"; `Help.vue:350` "Efficient Frontier: Optimal portfolio allocation analysis"; README "Advanced features: Shipped: Portfolio optimisation, Monte Carlo"; the vault overview lists efficient frontier as a key investment calculation.

How it fell out: the December 2025 Net Worth redesign hid the portfolio tabs behind a comment at `InvestmentList.vue:178`, "Hidden from dashboard, components still available for detail views". Four of those five tabs later got detail routes (`holdings-detail`, `tax-efficiency`, `fees-detail`, `strategy-detail`). The fifth, "Optimisation", never did. The July lint fix then deleted the imports. Nobody decided to drop the feature.

Recommendation: this is CSJ's decision, and it is a product decision, not a cleanup one. Two honest options.

- **A. Re-mount as an "Optimisation" detail route**, the missing fifth sibling of the four that exist, reusing the commented scaffold. Costs before it can ship: 15 of the 152 dead files carry Rule 12 score strings, 11 carry emoji or glyphs, 4 carry tax literals, and the whole cluster predates the design system, so this is a rebuild on the old code, not a re-import. It also needs `compliance-lead` review: "optimal portfolio" and "maximise Sharpe" are closer to a recommendation than anything else in the app.
- **B. Retire the claims now** in `Help.vue`, the README and the vault overview, keep the backend and its tests, and record the analytics as a parked capability in `workforce/core/registry/capabilities.md`. The components can then be deleted with the backend intact for a later re-mount.

My recommendation is B immediately, because the Help text is a live false promise to a paying user today, followed by A as a specified mission if the vision's "wealthiest families" claim is meant literally. What must not happen is a third option: deleting the components on a count and leaving the promises in place.

6.3 Built and never mounted

- `Gamification/LevelCard.vue` (6 June): the plan said mount it on the web dashboard. `GamifiedDashboard.vue` now renders the level pie and progress bar from the same store. **Superseded. Delete.**
- `Insights/InsightCtaPanel.vue` (17 July): the Stage 5 migration comment says it swaps the default "Register free" call to action for the campaign-specific one when an article is linked to a campaign. It is not wired, so that swap never happens on any article. **Mount it. This is a missing marketing feature, growth-lead owns it.**

6.4 A live dead end: journey completion

`OnboardingWizard.vue:248` renders `<JourneyCompletionStep>`, a file deleted on 20 March in `717d24f97`. The route is live: `/planning/journeys` renders `JourneyCard`, which links to `/onboarding/journey/:journey`, and finishing the last step sets `showJourneyCompletion` at line 1344. From then the user should see nothing, and the `@next` handler that would move them on can never fire.

Not browser-verified. Reproduce on csjones by starting any journey from Planning, completing its steps, and watching the final screen.

Recommendation: raise as a new board item, high, web and /m in scope. Fix by either restoring a completion step or routing straight to the dashboard on completion, and cover it with a vitest that mounts the wizard in journey mode and asserts the completion state renders something.

6.5 Dead branches inside live templates

- `ProtectionDashboard.vue:6` renders `ProfileCompletenessAlert` with no import and no data; the `v-if` is always false. Harmless. **Delete the lines.**
- `InvestmentList.vue:179-218`, the commented tab block. **Resolve with 6.2**, then delete or restore.

A scan of every reached `.vue` for PascalCase tags with no import found only these and the journey step, plus one `<YAML>` inside a string literal. The hole is small today.

6.6 Smaller feature gaps needing a product answer

Dead file	What it did	Live today	Recommendation
<code>NetWorth/Property/AmortizationScheduleView</code>	mortgage amortisation schedule	only a mention in <code>LiabilityForm</code>	Decide. Cheap to re-mount on the mortgage detail, which <code>/m</code> already has as a route
<code>Savings/InterestRateComparisonChart</code>	user's rate against seeded market rates	rates are admin-maintained, 9 backend consumers, no user chart	Decide. The website promises "smart benchmarking"; if a recommendation surfaces the rates by other words, delete; not verified
<code>Preview/KeepDataOrFreshModal</code>	"keep it as a starting point?" on preview-to-register	no equivalent	Delete. Preview writes never persist, so there is nothing to keep
<code>Savings/MissingDataCard</code> , <code>SavingsDecisionPath</code>	savings guidance cards	<code>SavingsRecommendations</code> , <code>SavingsModuleOverview</code>	Likely superseded; confirm by reading
<code>UserProfile/*</code> statements	balance sheet, cash flow, P and L, tax summary	not found live	Decide. If financial statements are still a feature, they need a home
README "liquidity ladder"	<code>LiquidityAnalyzer.php</code> exists	no view, live or dead	Fix the README or build the view
README "human capital"	<code>RecommendationEngine.php</code>	<code>ProtectionCurrentSituation</code> , <code>ProtectionModuleOverview</code>	Delivered. No action

6.7 Two unrouted views

`views/Investment/AccountPerformancePanel.vue` and `PortfolioStrategyPanel.vue` are the only views no route reaches. Their siblings `AccountSummaryPanel`, `AccountHoldingsPanel`, `AccountFeesPanel` and `AccountRebalancingPanel` are routed. **Check whether the per-account performance and strategy tabs were meant to exist; route them or delete them with 6.2.**

7. The guard

W-0540's acceptance names a guard, and the guard is the item. Two changes:

1. **Replace the substring search with the import-graph walk.** The scratchpad `reach.mjs` is 30 lines and needs no dependency; port it into the Pest test or run it from vitest. A guard that passes dead subtrees is not a guard.
2. **Add the reverse check:** every `PascalCase` tag used in a reached template must be imported or registered in that file. That is the check that would have caught the journey dead end and the protection alert, and it is the one Vue itself never performs in production.

Prove both by mutation before closing: remove one import and watch each go red.

8. Corrections to the record

- `workforce/ops/board/W-0540-*.md` says 79 and describes the wide haystack as if it were in use; the guard uses the narrow one and the true count is 152 plus two views.
- `handover/September/04/handover-2026-09-04-session-1.md` and `CSJT0D0.md` frame the item as "delete the 79, blocked on approval for `git rm`". Withdrawn. The item is a per-cluster decision list, and roughly a dozen of the files are a lost feature.
- The May 12 review already knew. It should be cited on the board item so the next reader does not rediscover it.

9. What was verified, how, and what was not

Verified: the component tree and import graph of `origin/dev` at `41771cca0` are identical to the working branch; csjones serves `dev` at that commit with a web build of 2026-09-04 09:24; 151 of 152 dead names are absent from that build and all nine live controls are present; the walker reaches every known-live layout and view; the history of every parent deletion is from `git log`; the lint commit diff is quoted from `git show`.

Not verified: the journey dead end in a browser; whether savings market rates reach a user through a recommendation; the **UserProfile** statements' replacement; whether the 32 specs assert anything a live component does not already cover. Nothing in this report was tested by clicking. Every claim above the line is from code, history or the served bundle.

10. Decisions that are CSJ's, in order

- 1. **The analytics cluster (6.2):** re-mount as an Optimisation detail, or retire the claims now and park the capability. Recommendation: retire the claims today, then decide on the re-mount as a specified mission.
- 2. **Financial statements (6.6):** is the balance sheet, cash flow and P and L view still a feature? If yes it needs a home; if no, delete the **UserProfile** cluster.
- 3. **Amortisation schedule and rate benchmarking (6.6):** re-mount or drop.
- 4. **Approve the superseded deletions (6.1)** on the condition in that section, a per-file read before each directory goes, findings to the board first.
- 5. **Approve the two new board items:** the journey dead end (6.4), and the campaign CTA panel (6.3).
- 6. **Approve the guard change (7).**

Until 1 to 3 are answered, nothing in 6.2, 6.6 or 6.7 should be deleted. 6.1, 6.3 and 6.5 can proceed on approval of 4 and 5.

Appendix A: the 152 by directory

Directory	Unreachable	Of which the guard flagged
Actions	2	2
Admin	6	3
Dashboard	21	15
Estate	17	3
Gamification	1	1
Goals	10	8
Insights	1	1
Investment	40	20
Journey	1	1
Legal	1	1
NetWorth	3	2
Onboarding	3	2
Plans	2	2
Preview	1	0
Protection	8	2
Public	1	1
Retirement	9	2
Risk	3	3
Savings	5	3
Shared	5	1
UserProfile	11	6
WhatIf	1	0
